

Product Description

The choice of perfection

PRODUCT NO.: 82905

INLINE FUEL FILTER 6/8 MM

Line oil filters have a central task:

They protect machines and systems by removing impurities from the oil circulating through pipes.

Main functions of line oil filters

Protection against wear: They filter particles such as metal abrasion, dust or soot that could damage moving parts.

Prevention of faults: Contaminants can block valves, pumps or nozzles - filters prevent this.

Extending oil and machine service life: Clean oil means less maintenance and longer operating times.

Ensuring functionality: Stable pressure conditions and reliable lubrication are crucial, especially in hydraulic systems or oil heating systems.

Areas of application

Hydraulic systems: Depth filters are used in excavators, presses, machine tools etc. to remove even the smallest particles (from 1 micrometre).

Oil heating systems: Pre-filters in the oil line protect burners and pumps from dirt and water.

Industrial systems: In lubricating and insulating oil systems, they ensure constant quality and prevent breakdowns.
